

Please enter the following amended Abstract:

A fluid dispenser pump including a pump body (10), a piston (20) being slidably received in leaktight manner in the said pump body (10) to slide between a rest position and a dispensing position, the top edge (11) of the pump body (10) being fixed in a fixing ring (5) serving to assemble the said pump to a reservoir (1), an annular sealing gasket (100, 200) being disposed between the said pump body (10) and the said fixing ring (5), the said pump further being provided with a intake air passageway (80) between the reservoir (1) and the atmosphere, the said pump being characterized in that a filtration and/or treatment element (100) for filtering and/or treating the intake air is provided in the said intake air passageway (80), the said filtration element (100) being disposed between the said top edge (11) of the pump body and the said fixing ring (5).
